I began to experience vision problem at age 10, starting with the symptom of astigmatism. I had to wear eyeglasses when I was in class so that I could see what was written on the blackboard. When I changed to progressive eyeglasses, I constantly had to adjust myself to the eyeglasses. I had two pairs of eyeglasses, one for reading and another one for driving and distance vision. I was very much irritated by the inconvenience of having to keep adjusting the position of my eyeglasses when driving at night.

I sought for an advice from my son so he managed to find helpful information and recommended that I should try ISOPTIK. I decided to visit and got my eyeglasses made. The Ultra Individual Digital 3 D Progressive Eyeglasses I received are finely produced using the best digital 3D technology. They give great wearing comfort and crystal clear vision at all distances. I am now worry free about driving at night.
